Explore various sections Secured eFile is a simple to use file encryption solution that can either be used in an Enterprise solution or as a stand-alone client installation. The application allows you to password-protect multiple files, USB, emails and many more. It also has the option to make some adjustments to server and user profiles. Profile entities are added as the server is added. Each profile entity holds the authentication information that will be used when the SEP Client authenticates against a set of, or single SEP server. When a file, folder or USB device is secured the process includes storing information on where to look for authentication, the name of the user that should be able to access and from what server the application should authenticate that user. It comes with Secured eMail which is a simple to use email encryption solution. It also has Secured eFile feature which is a simple to use file encryption solution that can either be used in an Enterprise solution or as a stand-alone installation. This means that if you have 2 installs of SEP on the same box, you can install SEP in Windows and the other in Linux and they won't be able to exchange information with each other? It wouldn't surprise me. This seems to be a good feature for those who like to have multiple environments on the same box. ".... Provides a secure and convenient method to exchange encryption keys. Regards, Rasmus W. Nielsen Zswipe is an elegant software tool that frees you from the boring task of repeatedly entering your passwords, PIN numbers, etc. with its handy password strength meter. This tool will help you memorize the most important passwords faster and easier. The software will protect your computer with a random generated password of 15 characters long. The name of this handy tool is SysKeys. What it does is to generate an ID code for every OS in which it is running on. Every time a new or different system is installed or removed from the network, this ID code is lost. When SysKeys is active, it stores the ID code for every system on a key that is easy to remember and handle. As soon as SysKeys is stopped, this key is deleted, as it is in every system. As a result, the next time the system is booted, the ID code is regenerated for this new system. This handy tool will give you the control over the system ID code of all your operating systems. It is just the missing link that allows you to save the ID of your operating system as a key and remember it. It generates a random number of 15 characters, and allows you to assign it to a key, which you can use to assign a password or PIN to any of the systems. One of the unique features of this software tool is that it is the only one that allows you to open the lock of an application that is protected with a password. It does this by the help of "hidden scripts" that mimic a keyboard. This means that the password of the application is revealed by moving the cursor over it and pressing a button that triggers the action. When the application's password is disclosed, SysKeys allows you to remove the protection by entering your password. The software includes other features, such as: - A handy password strength meter. - Support for all Windows and MAC operating systems. - The ability to assign the ID of every system to a key and remember it. - Support for a variety of applications, including: Windows, Adobe, Picasa, and more. - Remove protection from applications. - Generate random numbers of 15 characters. - Ability to delete the ID key of any system. - Multiple languages. Key Features: - SysKeys is the only software tool that allows you to 2edc1e01e8
