The less I use Photoshop and Lightroom (“Photoshop CS”), the more I appreciate Elements. Lightroom (version 4, at least) is a much better expression of what is possible on a Mac than Photoshop CS6. With a full version of Word, suddenly I’m starting to think about publishing my images. Anything I want to store and share digitally, I do it in the Cloud - it’s a bit less-fun than being able to work on Alpha or Photoshop, but I like being able to grab a snapshot. PS/Elements gives new hope and direction to those of us who are eager to explore the world of digital imaging. Without the constraints of buying hardware, I think I’d make an even bigger leap. I have used Photoshop for over 15 years and recently switched from Elements to the program full time. As a white hat testing professional over the past 9 years, I could not be asked for a better photo editing software. My skills and experience have taught me to judge an image editing software by its capabilities and speed. I was amazed at the speeds of Photoshop on my MacBook Air. The responsiveness is excellent. I was also impressed how easy it was to learn and use the software. Since I have no prior experience with Elements, I started Photoshop with about 3 hours instruction. We work with lots of high-resolution 8x10 images for lab shots and product images. If you’re not already familiar with Photoshop, you’ll learn what’s new (and not so new) as you use it. As a photographer, I can’t imagine anything I can’t do in Photoshop (other than producing a full-length film - or getting paid for it - that demands the very best HD video resolution and workflow); I can’t imagine why anyone would want to invest in another photo editing package.

They can see it better than any other way for a lot of the tools. They can see it well in a computer. They can also go online and get more information. When you look at the frequency with which things get modified, it is nearly impossible to predict how this will affect the overall outcome of the final project. Even with adobe Photoshop, many people who use it have very little idea what they are doing. **What It Does:** Using the Liquify filter in Adobe Photoshop you can manipulate the appearance and size of objects in an image. By changing the setting to Localized and using the eyedropper tool, you can set it to the specific area that you are manipulating in the image. Then you can move or resize the object in the image based on that area. It's about the flexibility to bring together and design from 2D and 3D assets. All our product teams have also understood this and both products remain fully supported and consistently updated. You can't say the same for your competitors like Krita and GIMP. More specific questions such as "Photo editing apps don't offer the same amount of GPU optimization and speed as Photoshop", always need to be considered based on the different use cases. The fact is that all of our product teams really care about the user experience. Nearly all users are amazed by how powerful and easy it is to quickly and easily do almost anything Photoshop can do. There was a time, when we used to claim we are the best. But now we know we have to compete and innovate every day to win the user's heart and mind. So, we don't need to claim anymore. We do what it takes to ensure some day users say "Adobe Photoshop is not as good as Adobe Pixelmator." So, again, Adobe Pixelmator is there to ensure your users always get the best experience. Publishers, designers, and others are primarily using Pixelmator. Our calendar is showing over 50% growth for the last 2 years. Adobe is committed to serving the industry.
